- They tend to be caused due to improper digestion, high blood pressure or high blood pressure, lack of personal hygiene and many more.
- Hemorrhoids is also common amongst pregnant women, it could also take place in children and also can even be genetic in nature.

There are usually two main kinds of hemorrhoids based on the location of the hemorrhoid swelling at the round the anus:

Internal Hemorrhoids: They are situated inside the anal opening and they are difficult to diagnose since there are absolutely no pain receptors inside and so even the patient does not easily realize when they form.

“ *External Hemorrhoids: These are located outside the anal opening as well as they are usually easy to diagnose given that they are usually painful from the comfort of the initial phases. Due to improper eating habits, the stool becomes hard and injures the soft and delicate inner mucosal lining of the anal sphincter and the rectum accountable for absorption of essential nutrients. This causes anal fissures which aggravate the hemorrhoids. Due to high blood pressure there could be moderate to severe itching, irritation and pain. High blood pressure also may result in the hemorrhaging from the hemorrhoids leading to an embarrassing situation.
